A; Residues: 'z',2-4,'z',6-9 <BAC>
C; Comment: This peptide induces DNA synthesis in immature thymocytes, but not peripheral
in a variety of immunoassays.
C; Comment: See PIR: A60957 (sheep) for discussion of another possible N-terminal modifica
C; Superfamily: thymic factor

-I MISCELLANDROUS: AN ANALOG WITHOUT THE N-TERMINAL PCA RESIDUE WAS SYNTHESIZED AND FOUND TO EXHIBIT GREATER ACTIVITY (144%) THAN THE PARENT NEUROPEPTIDE. THE PORTION OF THE SEQUENCE OF LAR MOST CRITICAL FOR THE MYOTROPIC PROPERTIES IS LIMITED TO THE PENAMENT PRACTICE ENAMENT FIPRI.

-I SIMILARITY: BELONGS TO THE PYROKININ FAMILY.

"Primary structure and biological activity of bradykinin potentiating peptides from Bothrops insularis snake venom.";

J. Protein Chem. 9:21-227 (1990).

-1- FUNCTION: THIS PEPTIDE BOTH INHIBITS THE ACTIVITY OF THE ANGOTERNIA-CONVERTING FURNEME AND ENHANCES THE ACTION OF BRADXKININ BY INHIBITING THE KINASES THAT INACTIVATE IT.

IT ACTS AS AN INDIRECT HYPOTENSIVE AGENT.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Eukaryota; Metazoa; Chordata; Craniata; Queimada jararaca).

Dihydrollpoamide acetyltransferase component of pyruvate dehydrogenase
complex (EC 2.3.1.12) (E2) (Fragment).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Component J. 245:919-922(1987).

-I FUNCTION: The pyruvate dehydrogenase complex catalyzes the overall conversion of pyruvate to acetyl-CoA and CO(2). It contains multiple copies of three enzymatic components: pyruvate dehydrogenase (E1), dihydrolipoamide acetyltransferase (E2) and lipoamide dehydrogenase (E3).

-I CATALYTIC ACTIVITY: Acetyl-CoA + dihydrolipoamide = CoA + S-acetyldihydrolipoamide.

-I COFACTOR: THE E2 COMPONENT CONTAINS TWO COVALENTLY-BOUND LIPOYL
